
HONG KONG INSTITUTE OF VOCATIONAL EDUCATION
Laboratory 6: Quality Assurance and Test Coverage

Name : _____

Class : _____

Module Intended Learning Outcome (#3):

On completion of the module, students are expected to be able to:

- Develop the game software models for testing analysis.

Lesson Intended Learning Outcome:

On completion of this lab, students are expected to be able to:

- Apply the test coverage techniques in developing test cases.

TASK:

1. A Call Graph in testing shows the relationship between calling and called methods.

(a) Draw the Call Graph for the following program.

```
class StudentFactory {  
    public static Student createStudent( String kind ) {  
        if ( kind.equals("FT") )  
            return new FullTimeStudent();  
        else  
            if ( kind.equals("PT") )  
                return new PartTimeStudent();  
            else  
                return null;  
    }  
}  
  
abstract class Student { public abstract void whoAmI(); }  
  
class FullTimeStudent extends Student {  
    public void whoAmI() {  
        System.out.println("I am a full-time student!");  
    }  
}  
  
class PartTimeStudent extends Student {  
    public void whoAmI() {  
        System.out.println("I am a part-time student!");  
    }  
}  
  
public class Test {  
    public static void main( String[] args ) {  
        Student s = StudentFactory.createStudent(args[0]);  
        s.whoAmI();  
    }  
}
```

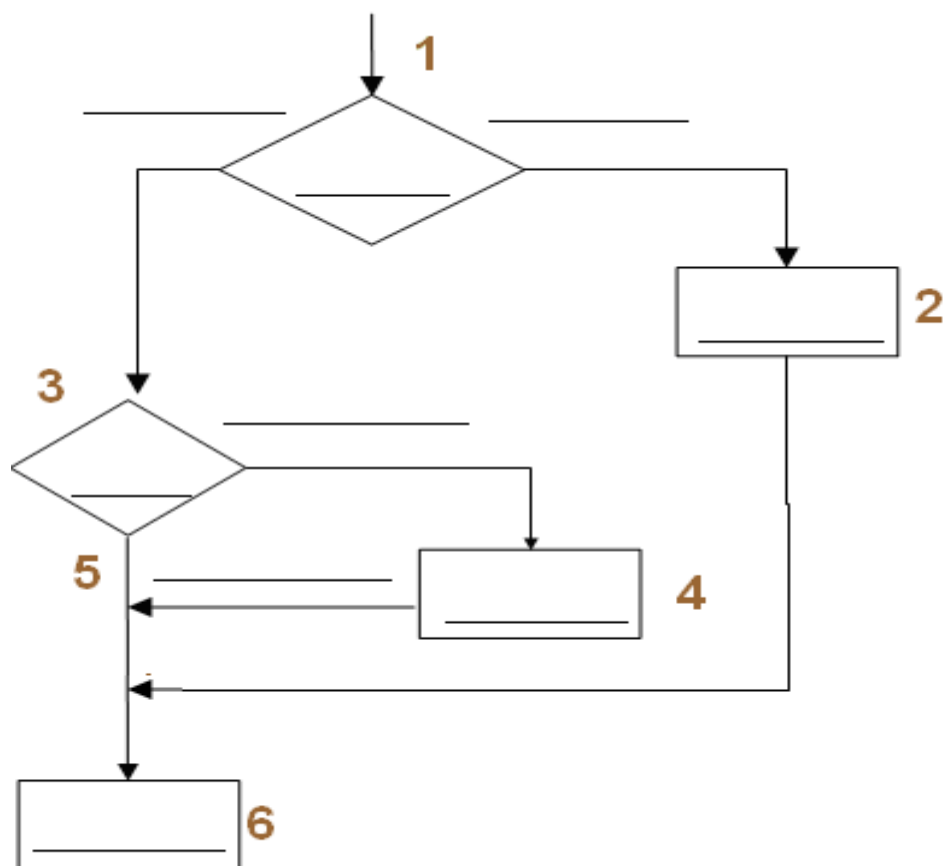

- (b) Explain why it is not possible to determine which *whoAmI()* method (of *FullTimeStudent* or *PartTimeStudent*) is called during development stage.

- (c) List all the possible scenarios when the test program Test.java runs.

2. Given the following JAVA coding.

```
public int proc(int a, int b, int x)
{
    if ((a>1) && (b==0))
    {
        x = x/a;
    }
    else if ((a==2) || (x>1))
    {
        x = x+1;
    }
    return x;
}
```

(a) Draw the control flow graph for the given coding;

- (b) Find the required test cases and the cooresponding paths to satisfy **Statement Coverage**. Give a set of possible input for each test case.

- (c) Find the required test cases and the cooresponding paths to satisfy **Branch Coverage**. Give a set of possible input for each test case.

- (d) Do you agree that all statements covered imply branch coverage condition? Justify your answer with your answers to part (b) and (c)?

3. Given the following JAVA program coding for the method *findMethod* in a Game program:

```

public int findMethod (int a) {

    S1  int x = a;
        int y = 25;

        while (x != y) { D1

            if (x > y) D2

                S2      x = x - y;
            else

                S3      y = x;
        }
    S4  return x;
}

```

Note: S1 through S4 are statement nodes and D1 through D2 are decision nodes in the program.

(a) Draw the Data Dependency Graph for the given JAVA program.

```

public int findMethod (int a) {

    int x = a;

    int y = 25;

    while (x != y) {

        if (x > y)

            x = x - y;

        else

            y = x;

    }

    return x;

}

```

(b) Draw the Control Flow Graph for the given JAVA program. (Please use the symbols S1-S4 as statmement nodes and D1-D2 as decision nodes)

(c) Identify **THREE** possible execution paths of the Control Flow Graph you answered in (b).

(d) Provide the following details to test the sub-path D2-S3 identified in the Control Flow Graph you answered in (b)

- Extend sub-path D2-S3 to a complete path;
- Find the set of data conditions required to complete the full path;
- Prepare the Equivalence Classes from the data conditions;
- Select an input data from the Equivalence Classes and give the Predict Output.

4. Given the following Java method :-

```

public int[][] deleteRows( int[][] anArray,
                           int firstRow, int lastRow )
{
    S1 int[][] result = null;
    int numRows = anArray.length;
    if ( ( firstRow >= numRows ) || ( firstRow < 0 ) ) D1
    {
        S2 System.out.println( "Bad first row." );
    }
    else if ( ( lastRow >= numRows ) || ( lastRow < 0 ) ) D2
    {
        S3 System.out.println( "Bad last row." );
    }
    else if ( lastRow < firstRow ) D3
    {
        S4 System.out.println( "Not a valid range." );
    }

    else
    {
        S5 int numNewRows = numRows - ( lastRow - firstRow + 1 );
        result = new int[numNewRows][anArray[0].length];
        int offset = 0;
        for ( int row = 0; row < numRows; row++ ) S8
        {
            if ( ( row >= firstRow ) && ( row <= lastRow ) ) D5
            {
                S6 offset++;
            }
            else
            {
                S7 result[row-offset] = anArray[row];
            }
        }
        S9 return result;
    }
}

```
